## Gender and Salary Study

Academic year 2011-2012

## Data

- Assistant Professor, Associate Professor and Professor
- Both tenure and non-tenure streams
- Excludes clinical faculty in the School of Medicine.
- Analyses were conducted on base salary
- Salaries for the School of Medicine and for the School of Dental Medicine are based on a 12-month appointment. Salaries for the School of Medicine excludes chairs.
- Salaries for all other schools are adjusted to a 9-month equivalent appointment and are adjusted to 100\% effort.
- Data are for AY2011-2012

## Method

- Tables include descriptive statistics using the 9-month equivalent adjusted salary except for faculty in the School of Medicine and for the School of Dental Medicine where numbers are based on a 12-month appointment.
- Outliers with residuals >3 were removed from the analysis.
- Cells where $\mathrm{N}<3$ were not included in the salary tables.

## Calculating Residual Values

1. Regression analysis conducted for each school

- Dependent variable = 9-month equivalent adjusted salary (12-month salary for MED and DENT).
- Independent variables = age, rank, years in rank, tenure status, years since hire, highest degree, years since highest degree.

2. Using the regression analysis, a predicted value was calculated for each faculty member. Faculty members with standardized residuals above three were removed.
3. This predicted value was subtracted from the faculty member's actual salary, giving each faculty member "residual" value.

- Positive residual means person is being paid more than the above independent variables would predict.
- Negative residual means person is being paid less than the above independent variables would predict.

## Graphs

- Graphs were created by plotting the average residual for men and the average residual for women in each school.
- Positive residual for women in a particular school means that, on average, women in that school are being paid more than the independent variables would predict.
- Negative residual for women means that, on average, women are being paid less than the independent variables would predict.
- This description of methods explains the RTIN bars on each chart. The RTOUT bars were calculated in exactly the same way with one exception: rank and tenure were removed from the initial regression equation.

## Limitations of the Analysis

- No measure of productivity in the regression analysis
- Examining residuals by group is a "broad brush" technique for highlighting where differences might exist.
- Residual values in this population have very high standard deviations, often exceeding 100 times the mean value.
- Analysis is strongly affected by extreme high/low values.

## College of Arts and Sciences - Humanities

| Rank | Gender | N | Mean | Std. Deviation |
| :--- | :--- | ---: | ---: | ---: |
| Assistant Professor | Male | 13 | $\$ 60,459$ | $\$ 3,173$ |
| Assistant Professor | Female | 10 | $\$ 59,660$ | $\$ 2,551$ |

## Revised Model

## Results

- R-squared=. 808
- Gender (F-1) had a direct effect on the following variables(p<.05).
- Years since hire (-)
- Rank (-)
- Tenure track (-)
- Tenure status (-)
- Years in rank (-)
- Appointment in nursing (+)
- Appointment in engineering (-)

## Results

- Controlling for all other variables in the model, the direct effect of gender on salary was $\$ 1,805$. While this effect was not statistically significant, the indirect and total effects of gender on salary are substantial.
- Of note, this discrepancy represents an overall average for the university, while individual schools/units vary in the amount and direction of salary differences. Moreover, within schools, there may be differences within ranks/disciplines.
- This analysis does not consider productivity, an important component of salary.

## Results

- The largest differences reside in management, law, medicine, and in the CAS Humanities.
- The gap in medicine has decreased annually over the last 3 years.
- The gap has increased in law and the humanities over the last 3 years.

## Results

- Women's overall pay was less than men's for the following reasons:
- Women were more likely to be recent hires
- were more likely to be of lower rank,
- were less likely to be on the tenure track,
- and had spent less time at their current rank.

## Recommendations

- The following efforts are recommended for the advancement of women faculty:
- Enhance mentoring for female faculty to increase the likelihood that women faculty will achieve tenure and promotion to full professor in a timely manner. This will assure that salary increases will occur earlier in female faculty careers.

## Recommendations (Cont.)

- Currently, few female professors of higher rank are hired. Actively recruiting female faculty at senior ranks would reduce gender differences in salary where they exist.
- More women faculty need to be promoted to leadership positions. For example, within the School of Medicine, only one department chair is female.
