Center for AIDS Research
Disclosures

Dr. del Rio has served as a consultant for ViiV Healthcare and is a member of the Board of Directors of IASUSA and ACTHIV
U.S. HIV Care Continuum, 2014

National goals
90%
80%

≥1 visit
≥2 visits ≥90 days apart

National HIV/AIDS Strategy indicators based on Care Continuum

90% Diagnosis

Indicator 1: ↑ % of people living with HIV who know serostatus to 90%

85% Linkage to Care

Indicator 4: ↑ % of newly diagnosed persons linked to care within 30 days of dx to 85%

90% Retention

Indicator 5: ↑ % of persons with diagnosed HIV who are retained to care to 90%

80% Viral Suppression

Indicator 6: ↑ % of persons with diagnosed HIV who are virally suppressed to 80%

Challenges to improving outcomes and interventions to address them:

• Not enough testing:
  • increase testing (New USPSTF recommendations)

• Delays in Care:
  • Linkage to care (ARTAS)

• Drop out of Care:
  • Retention and re-linkage interventions

HIV TESTING AND KNOWLEDGE OF SEROSTATUS

• Knowledge of HIV serostatus is the pivotal step in directing interventions to prevent HIV infection.

• Approximately 50% of people infected with HIV worldwide don’t know their serostatus.
  • In the US now < 20%

• In the US infected persons unaware of their serostatus account for 45% of new infections.
Barriers to Testing

• Thought not at risk

• Feared HIV+ diagnosis

• Lack of symptoms

• Failure of provider to suspect diagnosis

• Low level of literacy about disease or self-care
Possible Causes for late testing

- Stigma, fear of discrimination
- Poor performance of testing programs
  - Not targeting testing to high risk populations
  - Missed opportunities for testing in healthcare settings
- Administrative barriers
  - Requirement for written informed consent
  - Requirements for pre-test counseling
  - Requirements to have physician authorize test
Recommendations from the USPSTF

Screening for HIV: U.S. Preventive Services Task Force Recommendation Statement

Virginia A. Moyer, MD, MPH, on behalf of the U.S. Preventive Services Task Force*

Description: Update of the 2005 U.S. Preventive Services Task Force (USPSTF) recommendation statement on screening for HIV.

Methods: The USPSTF reviewed new evidence on the effectiveness of treatments in HIV-infected persons with CD4 counts greater than 0.200 × 10^9 cells/L; effects of screening, counseling, and anti-retroviral therapy (ART) use on risky behaviors and HIV transmission risk; and long-term cardiovascular harms of ART.

Population: These recommendations apply to adolescents, adults, and pregnant women.

Recommendation: The USPSTF recommends that clinicians screen adolescents and adults aged 15 to 65 years for HIV infection.

Younger adolescents and older adults who are at increased risk should also be screened. (Grade A recommendation)

The USPSTF recommends that clinicians screen all pregnant women for HIV, including those who present in labor who are untested and whose HIV status is unknown. (Grade A recommendation)
Recommendations

• All adults and adolescents should be offered HIV testing at least one. Rating: AIII

• All persons should be informed prior to undergoing HIV testing however pretest counseling should be sufficient only to meet the individual’s needs and to comply with local regulations. Rating: AIII
Linkage to Care

Proportion linked to care within 1 month of Dx

Monitoring HIV Care in the United States
Indicators and Data Systems
INSTITUTE OF MEDICINE
OF THE NATIONAL ACADEMIES

Monitoring HIV Care in the United States
Indicators and Data Systems
INSTITUTE OF MEDICINE
OF THE NATIONAL ACADEMIES
Entry into HIV care: US

• Failure to initiate timely HIV care after diagnosis is common
  • ~75% of newly diagnosed link to care within 6-12 months
• Between 45-55% of individuals fail to receive HIV care during any year.
• About one third of individuals fail to access care for 3 consecutive years in some communities
• 25-44% of HIV+ are entirely lost to follow up in some settings

Gardner, et al., Clinical Infectious Diseases, 2011
Linkage To HIV Care: Vulnerable Groups

• Delay to treatment is more common in:
  • African Americans\(^1,2\)
  • Women (especially with children at home)\(^1-3,5\)
  • Uninsured\(^2\)
  • Immigrants\(^4\)
  • Less well educated\(^2\)
  • Injection drug users\(^2\)

Intervention to Improve Linkage: ARTAS

- 273 participants, 4 cities
- 78% diagnosed <6 m
  - more likely to enter care
- 90 d of strength-based case management (CM)
- Older clients, those with much outside help and non-crack users more likely overall to enter care.

Replicated in ARTAS II

Retention in Care

Proportion in continuous care (2 or more visits in preceding 12 months at least 3 months apart)
Early retention in care

- The first year in outpatient HIV medical care is a dynamic, formative & vulnerable time
- Poor early retention in care associated with:
  - Delayed / failed antiretroviral therapy (ART) receipt
  - Delayed time to VL suppression and greater cumulative HIV burden
  - Increased sexual risk transmission behaviors
  - Increased risk of long-term adverse clinical events
  - Worse ART adherence, CD4 & VL response and increased long-term mortality following ART start

Retention is critical...as it predicts virologic suppression

• However:
  • No great way to measure retention
    • IOM, HRSA, DHHS, etc...
  • We do not know much about who is lost to care
  • We have no tools to predict who will be at risk of poor retention
  • There are no interventions that have proven to be effective for retention
## Viral load suppression, Retained vs. not retained

*All can be misinterpreted if patients unknowingly transferred care elsewhere, were incarcerated, or died.

The value of the missing clinic visit

- 3,672 HIV-infected patients in CNICS sites (2000 – 11):
  - 64% and 59% met IOM and DHHS retention indicators
  - 32% had zero missed visits following ART initiation
  - 333 died (8.5%) during follow up

- Failure to achieve the IOM indicator (HR = 2.2); the DHHS indicator (HR = 2.4) and missed clinic visits at 24 months (HR = 3.2) were all associated with increased mortality

- Increased mortality risk among patients classified as retained in IOM and DHHS indicators among those with more missed clinic visits.

Mugavero M, et al. Beyond Core Indicators of Retention in HIV Care. CROI 2014 (Abst # 983)
Missed visits are clinically relevant and actionable events with prognostic value beyond core indicators of retention in care.

Take home message:
Toward an Understanding of Disengagement from HIV Treatment and Care in Sub-Saharan Africa: A Qualitative Study

Norma C. Ware¹, Monique A. Wyatt¹, Elvin H. Geng², Sylvia F. Kaaya³, Oche O. Agbaji⁴, Winnie R. Muyindike⁵, Guerino Chalamilla⁶, Patricia A. Agaba⁴
• Six HIV-specialty clinics
• Pre-intervention (2008-09) vs intervention (2009-10) periods
• Clinic attendance improved 7% during the intervention period for keeping 2 consecutive visits and 3% for all visits kept
CDC/HRSA REPC Efficacious for HIV Care Engagement

- RCT at 6 HIV clinics
- N=1838
- 3 study arms (1:1:1)
  * Enhanced Contact (EC)
  * EC + skills (EC+)
  * SOC
- Outcomes @ 12-months:
  * Visit adherence
  * 4-month visit constancy
- EC & EC+ superior to SOC
- Efficacy in subgroups
- Not efficacious with youth, substance use, unmet needs

How to Stay Connected

- Keep all of your scheduled clinic appointments.
- Work as a team with your health care providers.
- Talk openly and honestly with your health care team.
- Ask questions that are important to you.

Why Is It Important to Keep All of Your Clinic Appointments?

Your Health Depends on It!

At your appointments

- We can check your health and make changes to your treatment plan if needed.
- We can give you the best medical care.
- You can take control of your health.

In one large study, people with HIV who attended all of their clinic appointments lived longer.
Source: Clinical Infectious Diseases, 2007.

Remember—it is important to come to all of your clinic appointments whether you feel sick or feel well.

Ways to Remember Your Clinic Appointments

- Write all of your appointments in a calendar.
- Put reminders or alerts in your cell phone.
- Put your reminder card in a place where you will see it often.
- Make sure we have your correct telephone number and address.
- Let us know right away if your telephone number or address changes.

If something comes up and you can’t keep a clinic appointment, please call us at least 2 days in advance. It is important to reschedule if you miss an appointment.
Engagement in care is associated with decreased sexual risk behaviors

Clinical Infectious Diseases 2008; 47:577–84
Challenges to Linkage and Retention

• Providing newly diagnosed patients with timely appointments with HIV care providers

• Resources for short-term case manager/system navigators to support follow-up for patients who need it

• Capacity of care system to meet demand for HIV care

• Complexity of patients’ lives, including many with serious co-morbid conditions and many in potentially vulnerable groups (eg, African Americans, women, IDU, low education, immigrants)

Engagement in Care is Dynamic

What else is in your toolbox of interventions?
Patient navigators

• In 1990 Harold Freeman joined forces with the American Cancer Society and developed the first patient navigation (PN) program which was implemented in Harlem.

• The primary goal of PN is to assist patients in moving through the entire system of medical care.

• PN have been found to be improve outcomes in patients with cancer
Patient Navigators

The Opinion Pages | OP-ED CONTRIBUTOR | The New York Times

Why Black Women Die of Cancer

By HAROLD P. FREEMAN | MARCH 13, 2014

At Harlem Hospital, we provided free breast cancer screening beginning in 1979. But screening alone was not enough. Patients — who not only often lacked health insurance, but also struggled with a limited education and distrust of doctors — needed help making their way through the medical system. So in 1990, we pioneered the patient navigation program, which provided one-on-one support to patients with abnormal findings. The navigators helped patients obtain insurance, made sure they understood what was recommended, guided them through appointments and allayed their fears. Applying the two interventions in Harlem — breast cancer screening and patient navigation — raised the five-year breast cancer survival rate from 39 percent to 70 percent in 2000.
Patient navigators

• **Coordinate treatment care**
  • by assisting patients with completing necessary medical paperwork; scheduling, confirming, rescheduling and also accompanying patients to medical and treatment appointments; and facilitating communication between patients and care providers

• **Provide health education**
  • by providing written information, discussing diagnostic tests and treatment options and answering questions

• **Assist patients to overcome personal barriers**
  • by addressing lack of transportation, lack of childcare, lack of insurance, and lack of health knowledge

• **Provide psychosocial or emotional support**
  • either directly or by making appropriate referrals to social workers or support groups
Contingency Management

• The systematic reinforcement of desired behaviors and the withholding of reinforcement or punishment of undesired behaviors
• Effective strategy in the treatment of alcohol and other substance use disorders
• Has also been found to be useful in cocaine addiction
• Used in other chronic conditions
Poor access to effective substance abuse treatment is a major factor fueling HIV transmission.
Re-engagement in care

- Less well studied than linkage & retention
- Typical focus: patients w/ prior HIV care LTFU
- HRSA SPNS Outreach Initiative
  - 10 demonstration projects featuring pt navigation
  - Loss to care: mental illness, SA, unstable housing
- Other priority populations for re-engagement
  - Recently incarcerated
  - Recently hospitalized

Guidelines for Improving Entry Into and Retention in Care and Antiretroviral Adherence for Persons With HIV: Evidence-Based Recommendations From an International Association of Physicians in AIDS Care Panel

Melanie A. Thompson, MD; Michael J. Mugavero, MD, MPH; K. Rivet Amico, PhD; Victoria A. Cargill, MD, MSCE; Larry W. Chang, MD, MPH; Robert Gross, MD, MSCE; Catherine Orrell, MBChB, MSc, MMed; Frederick L. Altice, MD; David R. Bangsberg, MD, MPH; John G. Bartlett, MD; Curt G. Simoni, PhD; and Jean B. Nachega, MD, PhD, MPH

Description: After HIV diagnosis, timely entry into HIV medical care and retention in that care are essential to the provision of effective antiretroviral therapy (ART). Adherence to ART is among the key determinants of successful HIV treatment outcome and is essential to minimize the emergence of drug resistance. The International Association of Physicians in AIDS Care convened a panel to develop evidence-based recommendations to optimize entry into and retention in care and ART adherence for people with HIV.

Methods: A systematic literature search was conducted to produce an evidence base restricted to randomized, controlled trials and observational studies with comparators that had at least 1 measured biological or behavioral end point. A total of 325 studies met the criteria. Two reviewers independently extracted and coded data from each study using a standardized data extraction form. Panel members drafted recommendations based on the body of evidence for each method or intervention and then graded the overall quality of the body of evidence and the strength for each recommendation.

Recommendations: Recommendations are provided for monitoring entry into and retention in care, interventions to improve entry and retention, and monitoring of and interventions to improve ART adherence. Recommendations cover ART strategies, adherence tools, education and counseling, and health system and service delivery interventions. In addition, they cover specific issues pertaining to pregnant women, incarcerated individuals, homeless and marginally housed individuals, and children and adolescents, as well as substance use and mental health disorders. Recommendations for future research in all areas are also provided.

For author affiliations, see end of text.
This article was published at www.annals.org on 6 March 2012.
Recommendations for entry into and retention in HIV care

• Systematic monitoring of successful entry into HIV care is recommended for all individuals diagnosed with HIV (II A).

• Systematic monitoring of retention in HIV care is recommended for all patients (II A).

• Brief, strengths-based case management for individuals with a new HIV diagnosis is recommended (II B).

• Intensive outreach for individuals not engaged in medical care within 6 months of a new HIV diagnosis may be considered (III C).

• Use of peer or paraprofessional patient navigators may be considered (III C).
Conclusions

• Engagement in HIV care is increasingly recognized as a critical step in patient outcomes
• Linkage and retention are interrelated but distinct processes
• Early missed visits can identify patients at high risk of poor outcomes
• Just as we have gotten used to discussing medication adherence with our patients, we also need to discuss “clinic adherence”
Recommendations

• Track no-show rates and out of care
• Minimize unmet need:
  • Strengthen access to substance use, mental health, case management, and social services
• Streamline your clinic processes to reduce barriers for persons attending clinic:
  • Bringing patients back is much more difficult once out of care completely
• Improve the customer’s experience
